## EXPOSING THE COMING BIO-TERROR PANDEMIC

**BIOTERRORBIBLE.COM:** The following whitepapers were published by think-tanks, universities, NGO's and various governmental agencies and have at the very minimum set the stage psychologically for the impending bio-terror induced pandemic. The simple fact that these whitepapers exists in mass confirms that an upcoming bio-terror attack is in the cards and may be played in a last ditch effort to regain political, economic and military control of society.

**WHITEPAPERS:** [Army War College](#) , [ASM \(American Society for Microbiology\)](#), [CATO Institute](#), [Center for a New American Security](#), [Center for Biosecurity of UPMC](#), [Center for Counterproliferation Research](#), [Chemical and Biological Arms Control Institute](#), [CRS \(Report for Congress\)](#), [GAO \(General Accounting Office\)](#), [Institute for National Strategic Studies](#), [Institute for Science and Public Policy](#), [Johns Hopkins University](#), [National Academy Of Engineering](#), [National Defence University](#), [PERI \(Public Entity Risk Institute\)](#), [RIS \(Research & Information System\)](#), [Terrorism Intelligence Centre](#), [The Federalist Society](#), [UNESCO \(United Nations\)](#), [University of Laussane](#), and the [WMD Center](#).

**Title:** [Responding To The Threat Of Smallpox Bioterrorism](#)

**Date:** April 18, 2002

**Source:** [CATO Institute](#) (PDF)

**Abstract:** The threat of direct terrorist attack against the United States proved to be real. And the subsequent anthrax cases point to the possibility of a future bioterrorist attack, including use of the deadly smallpox virus. The nature of terrorism is such that it is impossible to accurately predict the probability of such an attack, but the potential consequences are catastrophic. Therefore, it is a serious threat that deserves serious attention.

The current ring containment strategy (administering smallpox vaccinations only after an outbreak in the hope of containing the spread of the virus) favored by the federal government may be appropriate for dealing with a natural outbreak of smallpox, but it is likely to be woefully inadequate for countering a direct attack by a thinking enemy intent on inflicting infection, death, and panic.

A better approach than leaving the entire population at risk and responding to a smallpox attack after the fact would be to take preventive measures. The current stockpile of smallpox vaccine can be effectively diluted to create a more abundant supply, which—along with a newly discovered stockpile and additional vaccine already ordered and scheduled to be delivered by the end of 2002—should be made available to the public. Even if only a small fraction of the population were vaccinated, a community immunity effect, which would lower the rate of transmission of a disease as well as significantly increase the chances of success of a ring containment strategy, would be produced. As a result, the chances of a successful attack would be lowered, and that could have a deterrent effect and might even prevent such an attack.

If the paramount obligation of the federal government is to protect the United States and its population, then an ounce of prevention in the form of a population partially vaccinated against smallpox will be more effective—both in deterring and in responding to a potential attack—than leaving the American public unprotected and completely at risk, hoping that a pound of cure will work after the fact ([CATO Institute, 2002](#)).
